The CareWell project takes the challenge of creating pathways of integrated care coordination, patient empowerment and home support.

- Since 2014, CareWell has been focusing on improving care for those patients aged 65 or over, with complex health and social care needs, facing a high risk of hospital or care home admission.
- ICT platforms used in CareWell allow for better care planning and facilitate access to and sharing of patient information between different care providers.
- CareWell’s ICT systems are specifically tailored to enhance elderly patients’ self-care and self-management and increase the patients’ health status awareness, enabling both patients and their informal caregivers to lead much more fulfilling lives.
- CareWell contributes to the long-term sustainability of European healthcare systems by providing evidence for a replicable and transferable deployment plan for ICT-enabled integrated care services.
- All six pilot regions have implemented new integrated care services as well as expanding on existing ones.
- The progress registered is illustrated in the diagrams on the right, which compare the maturity status of care services before (usual care – blue) and after the implementation of integrated care solutions (red).
